

1      **ABSTRACT**

2      Multimedia content is streamed over a network system from a server  
3      computer to a client computer. The client allows a user to enter a variable  
4      playback speed and varies the speed at which the multimedia content is rendered  
5      at the client. Time-scale modification technology is used to maintain the original  
6      pitch of any audio content, thereby maintaining its intelligibility.
